No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           w84422-41 represent the peptides obtained from randomised finger 2 sequences of zinc finger nucleotide-binding proteins that bind to HIV-1 target sequences. The peptides were produced in the course of the invention. The specification describes zinc finger nucleotide-binding protein variants with at least two zinc finger modules that bind to a cellular nucleotide sequence and modulate its function. Zinc finger correlations, and compositions containing them, are used to increase or proteins, and compositions containing them, are used to increase or reduce transcription of a gene linked to the cellular nucleotide sequence. The proteins are used specifically for treating or preventing cell proliferative disorders (an humans, animals or plants, including those induced by viruses), particularly where expressed from nucleic acid by gene therapy (including ex vivo methods). Typical diseases that can be created are many forms of cancer, psoriasts, pemphigus vulgaris, Bechet's syndrome and lipid histicoytosis, also treatment of human immune deficiency virus (HIV) and other viral infections, and production of transgenic plants resistant to bacterial and viral diseases. The present oligonucleotide is used in the course of the invention.

A method of identifying a hsp binding peptide comprises (a) contacting a phage display library having bacteriophage expressing, in a surface protein, inserted peptides with a hsp target, and bound to a benzoquinone ansamycin antibiotic (BAA), in a physiologic binding buffer; (b) isolating a phage binding to the hsp target, and (c) identifying the inserted peptide expressed. The peptides which bind to a hsp can be used as tethering peptides for a hsp which may serve as an accessory in a chaperone process and/or may comprise a cytokine. They can also be coupled to antigens to induce an immune response. Such compositions can be used for treating neoplastic disease, e.g. ancers, infectious diseases, e.g. diseases caused by a bacterium, virus, protozoan, mycoplasma, fungus, yeast, parasite or prion, or a disease of the immune system, e.g. acquired immune deficiencies or

the sequence of unknown peptides or proteins with no sub-sequence identity, to be characterised using mass spectrometry. Sequences W87101 to W87364 represent a library of linear peptides constructed to exemplify the method. The isoleucine residue in these peptides can be replaced by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to a method for determination of the amino acid sequence of an unknown peptide. The method comprises (a) determining the molecular mass and an experimental fragmentation spectrum for the peptide; (b) comparing the experimental fragmentation spectrum of the unknown peptide with a theoretical fragmentation spectrum of the unknown peptide library composed of all possible linear sequences of amino acids having a total mass that corresponds to the molecular mass of the unknown peptide; and (c) identifying a peptide in the library with a theoretical fragmentation spectrum that most closely matches the fragmentation spectrum of the unknown peptide. The method is useful in DNA cloning, anti-body production, identification of recombinant products, and the study of post-translational modifications. It allows
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Amino acid determination; molecular mass; fragmentation spectrum; DNA cloning; anti-body; recombinant; modification; mass spectrometry.
         A melanoma-specific immunogen homologous with pWel-17 comprises one or more CTL (cytotoxic T lymphocyte) epitopes from the group R82098-R82194 capable of eliciting a CTL response. The epitopes R82098-R82108 are of particular interest. The immunogen can be used for partial protection in mammals against melanoma peptides which are homologous with pWel-17 are highly potent stimulators of HLA-A2+CTLs in several cell lines and can be used in immunotherapy or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide sequence determination used in e.g. DNA cloning - by comparing mass spectra of the unknown peptide with a library

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a method for determination of the amino acid sequence of an unknown peptide. The method comprises (a) determining the experimental fragmentation spectrum for the peptide, (b) comparing the experimental fragmentation spectrum of the curknown peptide with a theoretical fragmentation spectra calculated for a peptide library composed of all possible linear sequences of amino acids having a total mass that corresponds to the molecular mass of the unknown peptide; and (c) identifying a peptide in the library with a theoretical fragmentation spectrum that most closely matches the cragmentation spectrum of the unknown peptide. The method is useful in DNA cloning, anti-body production, identification of recombinant products, and the study of post-translational modifications. It allows the sequence of unknown peptides or proteins with no sub-sequence identity, to be characterised using mass spectrometry. Sequences (admitty, to be characterised using mass spectrometry. Sequences (admitty) the isoleucine residue in these peptides constructed to exemplify leucine to construct another 264 linear peptides to be included in the

They inhibit signal transduction mediated by cytokine:receptor binding (of cytokines that bind to receptors with a gamma-chain). They are used to inhibit or suppress cytokine-mediated immune responses, growth, proliferation, function and activity of cells. Particularly they are used for treatment or prevention of lymphoma, leukaemia, allergy for treatment or prevention of lymphoma, prolimeration, autoimmune disease (e.g. rheumatoid arthritis, lupus, multiple sclerosis or mysathenia gravis), graft vs. host disease and transplant or graft rejection. They inhibit function of interleukin gamma -chain), so function as immunosuppressants by reducing common proliferation of T and B cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Peptide mimetic; gamma-chain; cytokine receptor; signal transduction; autoimmune disease; graft vs. host disease; transplant rejection; graft rejection; interleukin; immunosuppressant; T cell; B cell.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence
                                            Y77439;
      vassion to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, Al, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived.

Cytotoxic T lymphocytes (CTLs) which destroy antigen-bearing cells are normally induced by an antigen in the form of a peptide fragment bound are particularly important in tumour rejection and in fighting viral infections are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially humans) cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or section con useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLS ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ö
                                                                                                                                             Immunogenic peptide having a human leukocyte antigen binding motif #2388.

The invention relates to peptidomimetic compounds (Y77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking. VLA-4-mediated leukocyte adhesion to the CS-1 FN of endothelial cells is also a critical step in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and acute immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and allograft rejection. They may also be used to treat psortasis and other skin inflammations, demyelinating diseases of the central nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (e.g., multiple sclenosis), allergies, atherosclenosis, collis, diabetes, inflammatory bowel disease, kidney inflammation and restenosis, prior art inhibition of VLA-4/CS-1 Interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on repeated administration, or the 25-mer CS-1 peptide, which is large and repetidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and the CS-1 peptide tested for their ability to inhibit VLA-4 Jurkat cells to immobilised CS-1 peptide (Y77410).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö

```
The peptide is a specifically claimed example of new aminomethyl-coumarin-labelled tetrapeptides of formula Ac-Xaa-Xaa-Xaa-Xap-AMC. The tetrapeptides are used to generate a fluorescent positional scanning synthetic combinatorial library for the investigation of the substrate specificity of cysteine and serine proteases, e.g. in the analysis of interleukin-1 beta converting enzyme substrate and other caspase substrates, and to identify inhibitors which may mediate inflammations. The library preferably comprises a mixture of at least 200 of the tetrapeptides.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New tetrapeptide coumarin derivatives - useful in combinatorial libraries to identify substrate specificity of cysteine or serine proteases e.g. interleukin-1 converting enzyme
                                                                                                                                                                                                                                                                                                                                                            /note= "the C-terminal is condensed onto 7-amino-4-methyl-coumarin via an amide linkage"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  human precursor IL-1beta; Graves' disease; Hashimoto's disease.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to peptidomimetic compounds (Y77415-Y77438) capable of inhibiting the binding of the VLA-4 integrin (alpha-4-beta-1, CD494/CD29) to the CS-1 portion (25 amino acids) of a splice variant of the extracellular matrix protein fibronectin (FN). VLA-4 is expressed on the surface of leukocytes; the CS-1 FN/VLA-4 interaction plays an important role in the maturation and trafficking VLA-4 mediated cleukocyte adhesion to the CS-1 FN of endothelial cells is also a critical enkocyte adhesion to the CS-1 FN of endothelial cells is also a critical cleukocyte adhesion to the CS-1 FN of endothelial cells is also a critical stop in the inflammatory response. The peptidomimetics of the invention may be used to treat both chronic and actte immunoinflammatory conditions, such as asthma, rheumatoid arthritis, osteoarthritis and other conditions, such as asthma, rheumating diseases of the central nervous system of allograft rejection. They may also be used to treat psoriasis and other skin inflammations, demyelinating diseases of the central nervous system (e.g., multiple sclerosis), allergies, atherosclerosis, colitis, clabetes, inflammatory bowel disease, kidney inflammation and restenosis. Prior art inhibition of VLA-4/CS-1 interaction either involves the use of anti-VLA-4 antibodies, which can themselves induce an immune response on corticolysis. Sequences vince smaller in comparison to the CS-1 peptidomimetics of the invention are smaller in comparison to the CS-1 peptide and therefore less expensive to manufacture, and are resistant to proteolysis. Sequences Y77411 and Y77414 and Y774410).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to nucleic acid molecules encoding rev-caspases. Rev-caspases are cysteine proteases that specifically cleave proteins after Asp residues and is expressed as a zymogen, in which the small subunit is N-terminal to a large subunit. A gene delivery vehicle comprising a rev-caspase coding sequence is useful for the treatment of cancer, where the gene delivery vehicle is internalised by tumour cells. The gene delivery vehicle can also be used to treat autoimmune diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated nucleic acid molecule encoding a rev-caspase - used for screening and identifying inhibitors or enhancers for treating
                                                                                                                                                                                                            The sequence is that of pre-interleukin (IL)-lbeta amino acids 112-116 which can be used as part of a method of inhibiting IL-lbeta protease activity in a mammal. It can be used in cpds. for the treatment of inflammation or to treat or prevent autoimmune disease such as inflammatory disorders.
                                                                                    New polypeptide having protease biological activity for interleukin 1-beta - can form inhibitor compsn. and cpds. for treatment of arthritis, auto:immune diseases, inflammation and radiation damage: also for wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The 5 amino acids correspond to the sequence of residues 112 to 116 of precursor IL-1 beta (see March et al., Nature, 315: 641-647 (1985)). Inhibitors of the invention comprise from 1 to 5 amino acid residues corresponding to at least a portion of AYVHD. Specific examples of suttable inhibitors are given including Boc-Asp-CH2F, Boc-Phe-Asp-CH2F and Ac-Pro-Asp-CH2F.

Cells transfected with a rev-caspase expressing vector can be used in identification of inhibitors or enhancers of caspase-mediated apoptosis. In vitro translated rev-caspase can be used to identify an inhibitor or enhancer of caspase processing activity. Caspase inhibitors are useful for treating neurodegenerative diseases as well as for inhibiting apoptosis in the heart following myocardial infarction. Sequences Y21738 represent caspase sensitive sites.
                                                                                                                                                                                                                                                 Peptide encoded by degenerate probe for soybean kunitz trypsin inhibitor.
                                                                                                                                                                                                                                                                                                                                                                                                                                   Toxin protein of Bacillus thuringiensis bacteria - improved in efficacy using a potentiating amt. of a trypsin inhibitor. The sequence contains
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The peptide is encoded by a degenerate probe and corresponds to amino acids 125-130 of soybean kunitz trypsin inhibitor.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The sequence is that of a peptide corresponding to Tyr113 to Arg120 of human precursor interleukin (IL)-lbeta sequence which contains the cleavage site (Hi8115-Pro118) for IL-lbeta protease. It shows a reactivity of 2.40 relative to the peptide comprising amino acids Ala112-Ser121 (R34851).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pentapeptide paralogue for use as chromatographic affinity ligand.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New polypeptide having protease biological activity for interleukin 1-beta - can form inhibitor compsn. and cpds. for treatment of arthritis, auto:immune diseases, inflammation and radiation damage; also for wound healing
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             .;

                                                                                                    A panel of 88 pentapeptides was designed on the basis of decreasing hydrophobicity and periodic variation of hydrophobic moment. The peptides were labelled with iodine-125 and tested with individual members of a basal antibody repertoire. (Spleen cells were harvested from mice and used to provide a panel of antibody-secreting hybridoma cells as a subset of the complete antibody-secreting hybridoma cells as a subset of the complete actla repertoire. Was observed. The test was than repeated with the addition of a defined amount of analyte to the mixture. A small number of wells showed greatly decreased labelling and these antibodies represented the successful result of an initial screen for those which preferentially bind analyte.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Pentameric mimotope 78 used to obtain highly specific antibodles.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Producing antibodies with high specificity and affinity for an analyte - by immunisation with selected mimotope, also analyte detection kits, useful for immunoassay of materials usually

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ó
                                                                                                                                                                                                                                                                                                                                                                                                                    Peptide is one of a panel, each of which have systemicly varied values of at least two parameters. A test protein is matched against the panel, and the paralogues with highest binding affinity are selected. Selected paralogues are bound to a matrix which is incorporated into the HPLC gel and used as affinity ligands. Technique is useful in chromatographic separation, purification and binding assay.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

moment. All the pentapeptides are acetylated at the N-terminus except E12 (for FTTC) (sic). E12 is not identified in the specification. The mimotopes are used in the method of the invention to obtain antibodies specifically and strongly reactive with a desired analyte. The mimotope is obtd. by reacting a panel of starting antibodies (Abs) representative of the resting B cell reperfoire of a mammal with an analyte (so as to identify analyte-reacting Abs) and then reacting each of a panel of candidate mimotopes representative of a random set of 3D contours with the analyte-reacting Abs) and subject is immunised with one or more mimotopes identified and the product Abs are recovered from the serum of the subject.
                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present peptide is a member of a panel of 88 pentapeptide mimotopes designed on the basis of decreasing hydrophobicity, and periodic variation of hydrophobic moment. The panel was synthesised using the method of Geysen, H. M., et al, Proc. Natl. Acad. Sci.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Identifying candidate drugs that bind a specific receptor by competitive reaction with panel of mimetope(s) - useful in rational

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neutrophil inhibitory factor; NIF; mutant; shock; stroke; allograft rejection; vasculitis; autoimmune diabetes; ARDS; rheumatoid arthritis; inflammatory skin disease; myocardial infarction; inflammatory bowel disease; adult respiratory distress syndrome; ischemia-repertusion injury; acute inflammation; bacterial infection; vaccine; parasitic worm infection; antihelminic.
                                                                                                                                                                                                                                                                                                                                Gaps
                                                           found. The test was then repeated with the addition of a defined amt. of analyte. A small number showed greatly increased labelling, these Ab representing the successful result of an initial screen for those that pref. bind analyte.

The above is an example of a claimed method for identifying members of a panel of candidate drugs, that bind to a receptor having a known ligand. It is useful in rational drug design, e.g. selection of monoclonal Ab for treating individual tumours, and for the prodn. Of immunological reagents for any analyte, including those not normally detectable by immunoassay, e.g trace contaminants in soil,
USA (1984), which uses lots of 96 pins; the remaining 8 polyethylene pins being controls. The mimotopes were then mixed, 125-I labelled and tested with individual members of a basal antibody (Ab) repertoire. Nearly uniform binding to all members was
                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Mutant Neutrophil Inhibitory Factors useful for treating inflammatory conditions and especially to prevent or decrease inflammatory responses

where at least 1 of the Asp residues at positions 18, 87, 110, 130, 197, or 223 in the wild type sequence (see Y23591) is replaced by a Gln residue. NIFs may be useful for treating shock, stroke, acute and chronic allograft rejection, vasculitis, autoimmune diabetes, rhemmatoid arthritis, inflammatory skin diseases, inflammatory bowel disease, adult respiratory distress syndrome (ARDS), ischemial repertusion injury following myocardial infarction, and acute inflammation caused by bacterial infection such as sepsis or bacterial meningitis. NIFs or NIF fragments may be used as vaccines against parasitic worm infection.

Chapman and be useful for detection of a mammalian host by a parasitic worm, as antihelminic agents, and in the detection of and isolation of NIF from tissue homogenates, cloned cells etc. NIFs may be useful for the detection of NIF mimics or antagonists in other compounds. Other NIF agonists and inhibitors may also be used as an inferior and inhibitors may also be used as a compounds. The present sequence is used in the course of

G) with clostripain. Similar peptides were then synthesised and tested for antimicrobial activity. 20 peptides, including R20331 and R20333, are claimed. The peptides are active against Grampositive and negative bacteria, fungi and protozoa. They can be used for treatment or prevention of infections and for the treatment and/or prevention of gingivitis. The IIGGR-related (R20311, R20332) can also be used to kill or control the growth of tumour cells or virus-
positive and negative bacteria, fungi and protozoa. They can be used for treatment or prevention of infections and for the treatment and/or prevention of gingivitis. The IIGGR-related (R20331, R20332) can also be used to kill or control the growth of tumour cells or virus.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence of synthetic peptide based on clostripain digest fragment of Cathepsin G (CAT. G).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New oligopeptide(s) with antimicrobial and antibacterial activity - useful in treatment of bacterial infection, e.g. gingivitis or periodontosis and to kill or control growth of tumour or virus-infected cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Antimicrobial; antibacterial; gingivitis; periodontosis; therapy; tumouricide; virucide; anti-viral agent; fungicide;

The peptide encoded by the probe is given in R55584.
                                                                                                                                                                                                                                                                                                           gene expression; vector; insect cell culture;

The invention relates to conjugate peptides engineered to noncovalently bind to heat shock proteins (hsp). A method of identifying a hsp binding bind to heat shock proteins (hsp). A method of identifying a hsp binding peptide comprises (a) contacting a phage display library having bacteriophage expressing, in a surface protein, inserted peptides with a hsp target, and bound to a henzoquinone ansamycin antibiotic (BAA), in a prigologic binding buffer; (b) isolating a phage binding to the hsp target; and (c) identifying the inserted peptide expressed. The peptides which bind to a hsp can be used as tethering peptides for a hsp which may serve as an accessory in a chaperone process and/or may comprise a cytokine. They can also be coupled to antigens to induce an immune response. Such compositions can be used for treating neoplastic disease, e.g. cancers, infectious diseases, e.g. diseases caused by a bacterium, virus, protozoan, mycoplasma, fungus, yeast, parasite or prion, or a disease of the immune system, e.g. acquired immune deficiencies or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Conjugate peptide; heat shock protein; hsp; phage display library; virus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    surface protein; tethering peptide; chaperone process; cytokine; cancer; neoplastic disease; infectious disease; bacterium; immune system; fungus; acquired immune deficiency; autoimmune disease.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Gaps

                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                             The invention relates to conjugate peptides engineered to noncovalently beind to heat shock proteins (hsp). A method of identifying a hsp binding peptide comprises (a) contacting a phage display library having bacteriophage expressing, in a surface protein, inserted peptides with a hsp target, and bound to a benzoquinone ansamycin antibicitic (BAA), in a physiologic binding buffer; (b) isolating a phage binding to the hsp target; and (c) identifying the inserted peptide expressed. The peptides which bind to a hsp can be used as tethering peptides for a hsp which may serve as an accessory in a chaperone process and/or may comprise a cytokine. They can also be coupled to antigens to induce an immune response. Such compositions can be used for treating neoplastic disease, e.g. chapers, protozoan, mycoplasma, fungus, yeast, parasite or prion, or a disease of the immune system, e.g. acquired immune deficiencies or

Y45390 to Y48214 represent specifically claimed immunogenic peptides having a human major histocompatibility complex (MHC) Class I (also known as human leukocyte antigen (HLA) binding motif. The immunogenic peptides can bind to a specific HLA allele (i.e. HLA-A subtypes HLA-A2.1, A1, A3.2 or A24.1 or HLA-B or C) and induce a cytotoxic T cell response against the antigen from which the peptide is derived. Cytotoxic I lymphocytes (CTLs) which destroy antigen bearing cells are normally induced by an antigen in the form of a peptide fragment bound
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Immunogenic peptide having a human leukocyte antigen binding motif #2741.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human leukocyte antigen; binding; immunogenic; glycoprotein; MHC; HLA; immune response; T cell activation; major histocompatibility complex; cytotoxic T lymphocyte; CTL; tumour rejection; viral infection; cancer; prostate cancer; hepatitis B; hepatitis C; AIDS; renal carcinoma;
                                                                                                                                                                 Neutrophil inhibitory factors can be used in compositions to inhibit neutrophil activity e.g. adhesion to vascular endothelial cells, and which are useful in the therapy of conditions which involve abnormal or undesired inflammatory responses. The N-terminal end of the proteclytically processed NIF Clone designated AceNIF3 is ambiguous and so for cloning purposes an N-terminal sequence was generated based on sequence homology between this NIF clone and AceNIF3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        immunogenic peptides with HLA binding motif, useful in treatment
Neutrophil inhibitory factor peptide(s) – derived from nematodes, useful for therapy of inflammatory responses
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Southwood

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The specification describes mutant Neutrophil Inhibitory Factors (NIFs), where at least 1 of the Asp residues at positions 18, 87, 110, 130, 197, or 223 in the wild type sequence (see Y23591) is replaced by a Gln
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Neutrophil inhibitory factor; NIF; mutant, shock; stroke; allograft rejection; vasculitis; autoimmune diabetes; ARDS; rheumatoid arthritis; inflammatory skin disease; myocardial infarction; inflammatory bowel disease; adult respiratory distress syndrome; ischemia-reperfusion injury; acute inflammation; bacterial infection; vaccine; parasitic worm infection; antihelminic.
to a HLA molecule, rather than the intact foreign antigen itself, and are particularly important in tumour rejection and in fighting viral infections. The peptides are therefore useful therapeutically to treat or prevent viral infections and cancers in mammals (especially to treat e.g. prostate cancer, hepatitis B and C, AIDS, and renal carcinoma. They can be administered as vaccines to elicit an immune response in individuals susceptible or otherwise at risk of viral infection or cancer, or used to treat chronic or acute conditions. They are also useful diagnostically, and can be used to induce a cytotoxic T cell response, by contacting a cytotoxic T cell with the peptide e.g. to produce CTLs ex vivo for infusion back into a patient. The polynucleotides encoding the immunogenic peptides are also useful
                                                                                                                                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                          .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to methods for selecting a polypeptide from candidate proteins. The method comprises obtaining a library of vectors that encode distinct candidate polypeptides, where the vectors provide for the cell surface expression of the candidate polypeptides; expressing each of the candidate polypeptides on the surface of a host cell, and selecting a host cell that expresses a desired polypeptide. Methods for catalysing a chemical reaction and methods for stimulating an immune response are also provided. A host cell that expresses, on its surface,
residue. NIFs may be useful for treating shock, stroke, acute and arthritis, inflammatory skin diseases, inflammancy bowel disease, rheumatory bowel disease, adult respiratory distress syndrome (ARDS), ischemia-reperfusion injury following myocardial infarction, and acute inflammation caused by bacterial infection such as sepsis or bacterial meningitis, NIFs or NIF fragments may be used as vaccines against parasitic worm infection. Anti-NIF antibodies may be useful for detecting infection of a mammalian host by a parasitic worm, as antihelminic agents, and in the detection be useful for the detection of NIF from tissue homogenates, cloned cells etc. NIFs may be useful for the detection of NIF from tissue homogenates, cloned cells etc. NIFs may be useful for the detection of MIF mimics or antagonists in other compounds. Other NIF agonists and inhibitors may also be used as antihelminic agents. The present sequence represents a N-terminal
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Enzyme; antibody; catalysing; immune response; digoxin; digitoxin; scFv; assay; cytokine; transcription factor; clotting factor; chelating agent; hormone; receptor; single chain Fv; flourescence activated cell sorting;

```

cytokine or chemokine. Sequences W86287 to W86300 represent peptide fragments of a rodent interleukin ($1\mathrm{L}$)-1 delta polypeptide.

```
ö
a single-chain antibody that binds immunologically to a digoxin, but does not bind immunologically to digitoxin is also provided. The methods can be used for obtaining desired polypeptides such as an antibody or antibody fragment, an enzyme, a cytokine, a transcription factor, a clotting factor, a chelating agent, a hormone or a receptor. Assays can be conducted with remarkable rapidity as the polypeptides are displayed on the surface of a host cell. The methods allow production of large quantities of these polypeptides, potentially on a kilogram scale, from microorganism cultures. Sequences W89128 to W89131 represent anti-digoxin single chain FV (scFV) antibody variants isolated from a light chain library LCDR3 by flourescence activated cell sorting (FACS).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   binds polyclonal antibodies (Abs) generated against a 12 consecutive amino acid segment of interleukin (IL)-1 delta or IL-1 epsilon. Agonists or antagonists of these IL polypeptides are used to regulate a cell involved in an inflammatory response. The IL-1 delta or IL-1 epsilon polypeptides and peptides are used to produce Abs and antigen-Ab complexes. The polypeptides, Abs and the corresponding nucleic acids regulate development and/or the immune system, and can be used to diagnose and treat conditions associated with abnormal expression of IL. Agonists or antagonists of IL-1 delta or IL-1 epsilon polypeptides are used with agonists or antagonists of IL-1 delta or IL-1 epsilon polypeptides are used with agonists or antagonists of IL-1 delta or IL-1 epsilon polypeptides may be used as a soluble polypeptide or as a fusion protein with another

Sequences W81101 to W87364 represent a library of linear peptides constructed to exemplify the method. The isoleucine residue in these peptides can be replaced by leucine to construct another 264 linear peptides to be included in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    sequence of an unknown peptide. The method comprises (a) determining actual the molecular mass and an experimental fragmentation spectrum for the peptide; (b) comparing the experimental fragmentation spectrum of the unknown peptide with a theoretical fragmentation spectrum of the unknown peptide with a theoretical fragmentation spectrum of the a peptide library composed of all possible linear sequences of amino acids having a total mass that corresponds to the molecular mass of the unknown peptide; and (c) identifying a peptide in the library with a fragmentation spectrum that most closely matches the fragmentation spectrum of the unknown peptide. The method is useful in DNA cloning, anti-body production, identification of recombinant products, and the study of post-translational modifications. It allows
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The invention relates to a method for determination of the amino acid

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ò
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method for determination of the amino acid sequence of an unknown peptide. The method comprises (a) determining the molecular mass and an experimental fragmentation spectrum for the peptide; (b) comparing the experimental fragmentation spectrum of the unknown peptide with a theoretical fragmentation spectrum of the unknown peptide with a theoretical fragmentation spectrum of the caids having a total mass that corresponds to the molecular mass of amino acids having a total mass that corresponds to the molecular mass of the unknown peptide; and (c) identifying a peptide in the library with a theoretical fragmentation spectrum that most closely matches the fragmentation spectrum of the unknown peptide. The method is useful in DNA cloning, anti-body production, identification of recombinant products, and the study of post-translational modifications. It allows the sequence of unknown peptides or proteins with no sub-sequence (dentify, to be characterised using mass spectrometry. Sequences W87101 to W87364 represent a library of linear peptides constructed to exemplify the method. The isoleucine residue in these peptides can be replaced by the second of the sequence of unknown periods and these peptides can be replaced by the second of the method. The isoleucine residue in these peptides to be included in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

These peptides may be prepared by chemical methods or may be isolated from soybean protease. These peptides do not cause antibody production or anaphylaxis. The peptides are broken down by host proteases and have, therefore, lox toxicity and

XX New peptide(s) isolated from pepsin digest of soybean - have immune activating activity and low toxicity
XX Claim 7: Page 2: 16pp; Japanese.
XX Claim 7: Page 2: 16pp; Japanese.
CC Tive present peptide is a soybean derived peptide, with immune activity and low toxicity.
CC It was prepd. by adding pepsin to a homogenate comprising 1 litre CC It was prepd. by adding pepsin to a homogenate comprising 1 litre CC activating water and 200 g of soybean, and ultrafiltering the resultant hydrolyaste. The filtrate was then conc. in vacuo and contine fraction was then subjected to HPLC to give 8 active fractions, one of which being the present peptide.
CC The peptide may also be prepd. by chemical synthesis using solid
XX Sequence 7 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Description

-i- CATALYTIC ACTIVITY: ATP + [MYOSIN HEAVY-CHAIN] - ADP +
[MYOSIN HEAVY-CHAIN] PHOSPHATE.
-i- DOMAIN: CONSISTS OF AN N-TERMINAL DOMAIN, A CENTRAL NONREPETITIVE
CATALYTIC DOMAIN, AND A C-TERMINAL DOMAIN WITH SEVEN WD REPEATS.
-i- SIMILARITY: CONTAINS 7 WD REPEATS (TRP-ASP DOMAINS).
-i- SIMILARITY: BELONGS TO THE MHCK / EF-2 PROTEIN KINASE FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps

                     The present sequence is a thymidylate kinase. TmpK is involved in the activation of the AIDS prodrug; AZT. AZT-TP inhibits viral replication by DNA chain termination. TmpK which catalyses the second phosphorylation step, from the monophosphate (AZT-MP) to the diphosphate (AZT-MP), is the rate limiting enzyme in the AZT activation pathway. Increasing the kinase activity of TmpK results in higher concentrations of the active form of the therapeutic analog especially AZT-triphosphate (AZT = 3, -azido-3 deoxythymidine) and thus a greater therapeutic effect, while reducing the concentration of the toxic monophosphate intermediate. This has anticancer and antiviral activities.

Its amino acid sequence was deduced from a gene (T$3071) obtd. From App genomic DNA. Recombinant Tbp1, or its antigenic fragments, can be produced in transformed host cells. It is used to formulate vaccines against porcine pleuropneumonia,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel polypeptides and their encoding nucleic acids derived from human pancreatic tumor tissue which have cytostatic activity. The sequences are also useful in producing pharmaceutical compositions for treatment of pancreatic tumors. Y73814-Y74222 represent protein fragments encoded by the human pancreatic tumor cDNA library derived expressed sequence tag (EST) sequences represented in
